1 Introduction

1.1 Objective

Objective: grouping of observations into clusters, so that

- similar observations appear in the same cluster
- dissimilar observations appear in distinct clusters

 \longrightarrow need for a measure for **similarity** and **dissimilarity**?

1.2 Example 1

Single cell transcriptomics: $n \times p$ Matrix for which - every column contains the expression levels of one of p genes for n cells - every row contains the expression levels of p genes for one cell ($\{sample\}$)

• Research question: look for groups of cells that have similar gene expression patterns

- Or, look for groups of genes that have similar expression levels across the different cells. This can help us in understanding the regulation and functionality of the genes.
- → both **observations** (rows) and **variables** (columns) can be clustered

1.3 Example 2.

Abundance studies: the abundances of n plant species are counted on p plots (habitats)

- look for groups that contain species that live in the same habitats, or, look for groups of habitats that have similar species communities
- → both observations (rows) and variables (columns) can be clustered

2 Hierarchical Cluster Analysis: Agnes

2.1 General Algorithm

- In step 0 each observations is considered as a cluster (i.e. n clusters).
- Every next step consists of:
 - 1. merge the two clusters with the smallest intercluster dissimilarity
 - 2. recalculate the intercluster dissimilarities

In step 0 the intercluster dissimilarity coincides with the dissimilarity between the corresponding observations $\ \leftrightarrow intercluster\ dissimilarity$?

2.2 Intercluster Dissimilarities

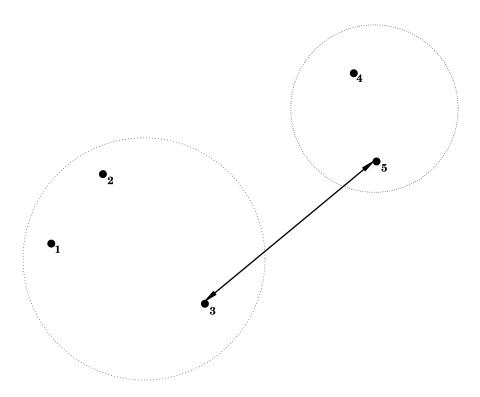

- Represent clusters (e.g. C_1 and C_2) as sets of points \mathbf{x}_i which belong to that cluster
- $d(C_1, C_2)$: intercluster dissimilarity between

We consider three intercluster dissimilarities.

2.2.1 Single Linkage = Nearest Neighbour

$$d(C_1, C_2) = \min_{\mathbf{x}_1 \in C_1; \mathbf{x}_2 \in C_2} d(\mathbf{x}_1, \mathbf{x}_2),$$

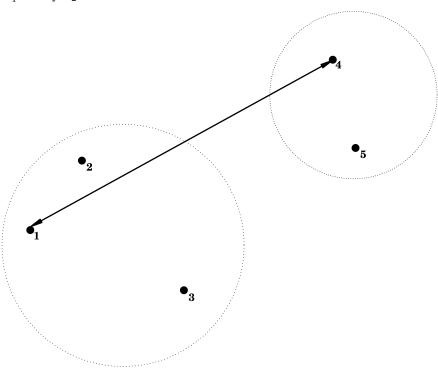

i.e. the dissimilarity between C_1 and C_2 is determined by the smallest dissimilarity between a point of C_1 and a point of C_2 .

2.2.2 Complete Linkage = Furthest Neighbour

$$d(C_1, C_2) = \max_{\mathbf{x}_1 \in C_1; \mathbf{x}_2 \in C_2} d(\mathbf{x}_1, \mathbf{x}_2),$$

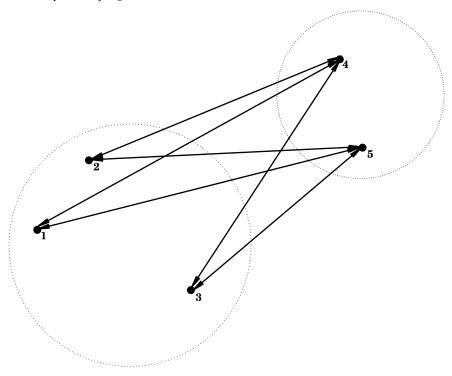

i.e. the dissimilarity between C_1 and C_2 is determined by the largest dissimilarity between a point of C_1 and a point of C_2 .

2.2.3 Average Linkage = Group Average

$$d(C_1, C_2) = \frac{1}{|C_1||C_2|} \sum_{\mathbf{x}_1 \in C_1; \mathbf{x}_2 \in C_2} d(\mathbf{x}_1, \mathbf{x}_2),$$

i.e. the dissimilarity between C_1 and C_2 is determined by the average dissimilarity between all points of C_1 and all points of C_2 .

2.3 Cluster Tree

Hierarchical nature of the algorithm:

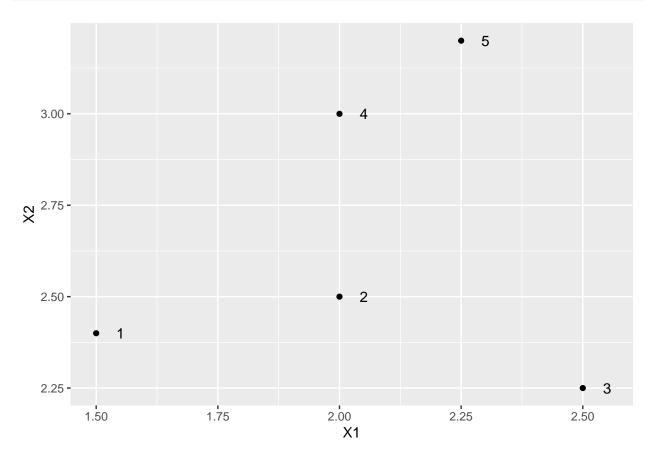

- $\bullet \ \ \textit{Nested sequence of clusters} \longrightarrow \textit{visualisation via a tree}$
- height of branches indicate the intercluster dissimilarity at which clusters are merged.
- Can used as instrument for deciding the number of clusters in the data

3 Toy example

<i>X1</i>	X2	label
1.50	2.40	1
2.00	2.50	2
2.50	2.25	3
2.00	3.00	4
2.25	3.20	5

```
library(cluster)
library(tidyverse)

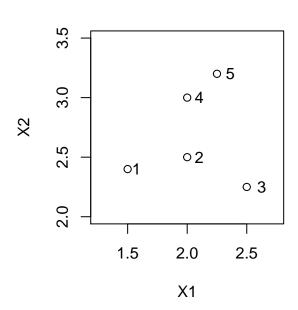

toy %>%
    ggplot(aes(X1, X2, label = label)) +
    geom_point() +
    geom_text(nudge_x = .05)
```

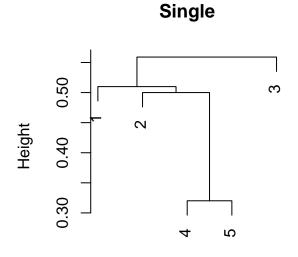

toy[,1:2] %>% dist

3.1 Single linkage

```
toySingle <- agnes(toy[,1:2], method = "single")
par(mfrow=c(1,2),pty="s")
plot(X2 ~ X1, toy, xlim = c(1.25,2.75),ylim = c(2,3.5))
text(toy$X1*1.05,toy$X2,label=toy$label)
plot(toySingle, which.plot = 2, main = "Single")</pre>
```

toy[, 1:2]
Agglomerative Coefficient = 0.21

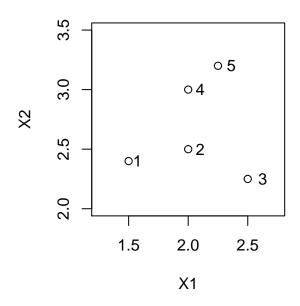

```
toy[,1:2] %>% dist
```

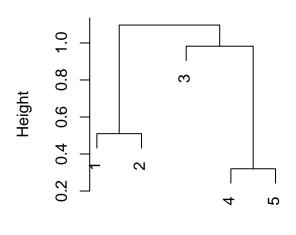

```
## 1 2 3 4
## 2 0.5099020
## 3 1.0111874 0.5590170
## 4 0.7810250 0.5000000 0.9013878
## 5 1.0965856 0.7433034 0.9823441 0.3201562
```

3.2 Complete linkage

```
toyComplete \leftarrow agnes(toy[,1:2], method = "complete") \\ par(mfrow=c(1,2),pty="s") \\ plot(X2 \sim X1, toy, xlim = c(1.25,2.75),ylim = c(2,3.5)) \\ text(toy$X1*1.05, toy$X2, label=toy$label) \\ plot(toyComplete, which.plot = 2, main = "Complete")
```

Complete

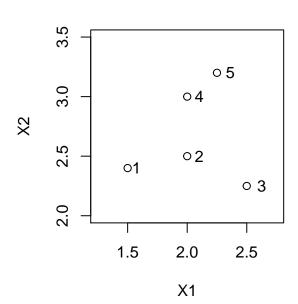

toy[, 1:2] Agglomerative Coefficient = 0.52

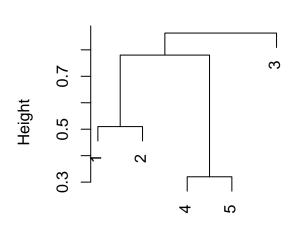

toy[,1:2] %>% dist

```
## 1 2 3 4
## 2 0.5099020
## 3 1.0111874 0.5590170
## 4 0.7810250 0.5000000 0.9013878
## 5 1.0965856 0.7433034 0.9823441 0.3201562
```

3.3 Average linkage

```
toyAvg <- agnes(toy[,1:2], method = "average")
par(mfrow=c(1,2),pty="s")
plot(X2 ~ X1, toy, xlim = c(1.25,2.75),ylim = c(2,3.5))
text(toy$X1*1.05,toy$X2,label=toy$label)
plot(toyAvg, which.plot = 2, main = "Average")</pre>
```

Average

toy[, 1:2]
Agglomerative Coefficient = 0.42

toy[,1:2] %>% dist

1 2 3 4

2 0.5099020

3 1.0111874 0.5590170

4 0.7810250 0.5000000 0.9013878

5 1.0965856 0.7433034 0.9823441 0.3201562
